NearHub Decode

NearHub Decode is a very important product in the overall solution of NearHub Rooms, which supports the transmission and distribution of audio and video conference signals through the network, and can be displayed on the same screen or different screens according to the number of displays in the conference room, or the display screens in different conference rooms. At the same time, it can also transmit the control signals of the mouse and keyboard, providing users with convenient remote management and maintenance functions

Product features

- Supports up to 4K 30fps HDMI output capability

- Distributed deployment of network audio and video

- Same/different display (with NearHub Rooms)

- KVM over IP
